

$\delta x = \Delta \tan \theta_x - \text{baseline}(\tan \theta_{\text{ref}})$: map $\delta y = \Delta \tan \theta_y - \text{baseline}(\tan \theta_{\text{ref}})$: map

efficiency vs edge distance

x-plane: outward angle residual (guard: $d_y > 40$ mm)y-plane: outward angle residual (guard: $d_x > 40$ mm)

position residual vs edge distance

drift-time span (T_{sat} proxy $\propto z_{\text{rec}}/v$) vs edge

recorded column proxy vs edge

ZONES (dist to nearest edge):

edge 0–25 mm | mid 25–60 | core >60

zone	n ev	v_x	v_y	T_x	T_y	δx	δy
edge	1107	21.8	28.2	750	834	-0.056	-0.002
mid	3552	34.1	27.5	670	721	+0.003	+0.008
core	10651	34.6	30.6	677	701	+0.006	+0.006

 v in $\mu\text{m}/\text{ns}$, T in ns; δ = outward angle residual (bias-subtracted)

angle source: unshared
