

What the capsule makes

per neutron entering it · counted above the X17 minimum angle

Wall pairs per X17

lower is better

Wall: internal pairs only, no external conversion (adds up to $\sim \times 6$, mostly at small angles). ^{27}Al (n, γ) below 845 keV bridged by hand ($1/v$, then log-log to ENDF).

Not included: γ flash, room background, (n, p) two-prongs. X17/IPC = 2.5 % is the rate table's assumption; the ratio scales with it.
