

Most capture γ fly straight through

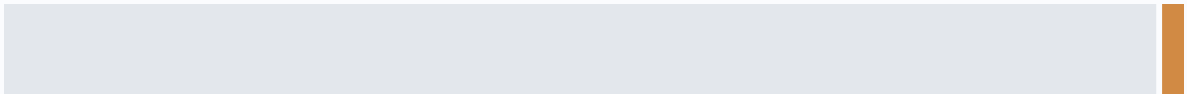

Geant4 · per (n, γ) capture · charge = ≥ 1 keV from charged tracks in one Micromegas drift gap, within 100 ms

Does the capture put charge in a chamber?

share

per 30 days

γ only: no charge in a chamber	97.9 %	2.4×10^{10}
charge in a drift gap → the next figure opens this up	2.1 %	5.1×10^8

the ones that do, by capture site

share

per 30 days

^{27}Al vessel	90.5 %	4.6×10^8
carbon-fibre wrap	1.4 %	7.2×10^6
captured elsewhere	8.1 %	4.1×10^7

Not counted: charge only from ^{28}Al β decays seconds to hours later (3.8 % of captures), which the data sees at random times, not with the pulse.
