

A sits below the others in every single run

short tracks, 26 runs, both access conditions — A is a factor 2.3 under C and D throughout

Short tracks only, so the length mixture cannot move between runs. Nothing here tracks the beam, the period or the 27 July access — A holds its separation run by run, which rules out a run-dependent cause and points at what is fixed per chamber: the calibration bundle. C and D interleave with each other, so this figure separates A from the pair and does NOT rank C against D.
