

Every chamber degrades with track length

the offset between them is what decides whether the two modes separate

Legs of the published pair sample, x view. A runs 1.5 → 21 (14×). C runs 2.8 → 26 (9×). D runs 3.1 → 129 (42×). The rise is universal, so the bimodality is universal; the floor each chamber starts from is not — and a chamber whose short tracks already sit near its long ones can never show two bumps.
