

The same chambers, read out on somebody else's trigger

PRELIMINARY

events in which THIS chamber's scintillators were silent and another arm made the trigger — no cut from its own acceptance, and no angle needed anywhere

The bar-length cliff and the gap shadow are gone: the whole surface is lit, out to the active edge. Chamber B is on this figure and on no other — a bystander is defined by which arm's scintillators fired, not by where a track points, so it needs none of the drift-field geometry B cannot supply. Occupancy, not efficiency: the illumination is the beam's own and is not flat, and nothing here confirms an individual track. Grey: hot channels, and the fiducial edge beyond which the plane fit rails. Chamber D is the exception and it is a real result, not a display artefact: a quarter of its x plane is dead and its hot channels carry a third of what is left, so its unbiased map is the one that does not work.
