opposing

worse leg's distance of closest approach to the beam axis [mm]

The 30 mm selection is the right-hand edge. The distribution rises INTO it, so the cut is not isolating a peak. Dashed is the same arm pair EVENT-MIXED — an accidental by construction. Where it lies under the data a cut here removes both alike; where they separate, there is something to cut on. Values off the axis are excluded from the curve but not from its normalisation, and the key gives the fraction.
