

Where perpendicular pairs meet — 101,557 pairs, each leg within 60 mm of the beam axis

Vertex = the two tracks' crossing in the transverse plane; y = mean of the two legs' y at that crossing. Bottom row: the no-source null (directions shuffled within each chamber, same cut) scaled by the x fit's background fraction and subtracted. The excess is a vertical band at the capsule's x: x is imaged, z (chamber D) is not. [ntof_athens_26/pair_vertex_imaging](#) | 33 runs of the condor full pass, stage-3 tracks, chambers A, C, D
