

Test 1: do the two legs meet at the capsule's depth more than independent capsule tracks do?

real: both legs in one trigger. mixed: legs from different triggers, each pointing at the capsule on its own. shuffled: directions swapped among tracks of the chamber, no leg points anywhere. ntof_athens_26/pair_vertex_imaging | 33 runs of the condor full pass; both legs slope-measured and not noisy in x and y, pointing within 30 mm of the measured capsule, clones removed
