

The vertex carries almost no coincidence information

and for opposing pairs it is below one -- the trigger, not the physics

A lift of 1 is not "the imaging failed": mixing moves the trigger, not the capsule, so both legs of a mixed pair still came from the same source. It says the vertex cannot be used to select pairs.

ntof_athens_26/pair_vertex_imaging | 33 runs of the condor full pass, stage-3 tracks, leg pointing cut as marked
