

Dropping y improves every class

solid: transverse crossing dotted: the published 3D DCA

and $|dy|$ is the whole of the difference

the transverse answer does not move; the 3D one follows it

The 3D closest approach is free to slide both tracks along themselves to reduce a y mismatch, and every millimetre it slides moves the vertex transversely too. ntop_athens_26/pair_vertex_imaging | 33 runs of the condor full pass, stage-3 tracks, leg pointing cut as marked
