

Single tracks already image the capsule along the beam

Top: y of each track where it passes the beam axis, x and y planes cleaned, x pointing < 30 mm, y angle scale as reconstructed; null: $\tan y$ shuffled among tracks of the same chamber, run and cuts. Bottom: robust width against the y scale; the copper line is the robust σ of the gas's own y distribution. The band scale sits low (background flattens the band) and the focus minimum high (a larger scale also shrinks the $\tan y$ noise), so neither is applied. ntof_athens_26/pair_vertex_imaging | 33 runs of the condor full pass, stage-3 tracks, chambers A, C, D
