

The y view is not a pointing measurement

the x band is pinned at 1 by the leg cut; the y band is not cut on at all half of it the impact heights, half the slope over a 270 mm lever

so the two legs disagree in y by 161 mm

Even a perfect y angle could not localise better than the source length: an 80 mm source seen over a 234.6 mm lever is a 23 mm irreducible y spread. ntof_athens_26/pair_vertex_imaging | 33 runs of the condor full pass, stage-3 tracks, leg pointing cut as marked
