

z from pairs within A and C, and from D-D (+ not in a noisy column on both legs, within 60 mm)

A-A and C-C lines both run along z, so their crossing locates x and hardly z. A-C lines come from opposite sides and their crossing does locate z, through the difference of the two chambers' x and slopes. D-D lines run along x, so their crossing locates z and hardly x — that column is chamber D again. ntof_athens_26/pair_vertex_imaging | 33 runs of the condor full pass, stage-3 tracks, chambers A, C, D
