

Expected: the wall makes the pairs

the capsule, analytic; pairs are internal conversion only

Geant4: AI fires the trigger

thermal gate, by capture nucleus

Data: pairs mostly accidental

run_145, scintillator Δt fit, 68 % intervals

PRELIMINARY

(a) ipc_aluminium.bookkeeping at the window median: wall captures from a single pass (floor) to the rate table's transported value (hatched); 0.0021 internal pairs per wall capture (EGAF/PGAA line list, Al + C); 0.0047 pairs per ${}^3\text{He}$ radiative capture (ipc_born, M1 + E0). External conversion of the 7.7 MeV γ in the wall is not included and only adds to the wall. (b) Geant4, 10^9 EAR2-flux neutrons, 0.5 MIP; 4 121 Al capture γ per pulse (ntof_run_report §6). (c) HANDOFF_ACCIDENTAL_TIMING §0. An accidental pair is two uncorrelated legs, and by (b) those are aluminium. A prompt pair is not identified: the capsule shape fits better than the gas (χ^2/dof 7.4 vs 11.0 perpendicular), but nothing here measures pair energy.
